# AUDITOR

WHAT'S NEW – MARCH 2024

AUDITOR STARTUP ISSUES INQUIRY AND REPORT

A new Auditor Startup Issues Inquiry window has been introduced. This window helps identify any encountered Auditor issues, particularly those related to initializing Form or Table audits.

If there is an initialization issue on startup, the Message Center Report will open, offering some insights into the detected issues. Additionally, you can access this information anytime through the Auditor Startup Issues Inquiry window. Here, you will find details on the message, along with options to print or export the data.

Note: this does not apply to SQL audits as they do not have an initialization process.

VERIFYING THE INSTALLATION

We recommend that you perform at least a few actions to verify that your installation works as expected. This is especially true when upgrading from a previous Dynamics GP version or a previous build of the product on the same Dynamics GP version.

Starting with this build, we have added the following **Verify the Installation** section to the end of the First Workstation Instructions in the user manual:

> Test at least one audit of each type (Form, Table, and SQL Table) using different user types (POWERUSER, Auditor Administrator, regular user, etc., as appropriate) in a company other than Fabrikam.

PERFORMANCE IMPROVEMENT

By default, we have added all hidden and background forms for any Rockton product to the Rockton Ignored Forms Setup table (RSIGNORE). This should help reduce processing time, especially in cases where these windows may be opened and closed repeatedly as part of a long-running process.
